

Weblogger Launch

1

Collect the number of Webloggers required for the shipment.

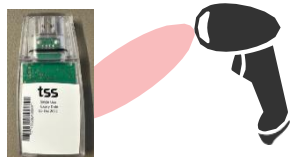

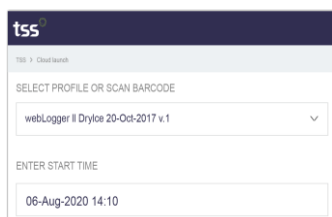

2

- Login to az.ccis.se
- Select "Cloud Launch"

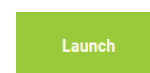

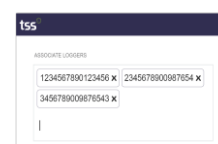

3

- Select profile.
- Scan Weblogger barcodes or type in Weblogger ID's
- Add Trip Tag shipment data into Cloud Launch.

4

- Verify that the Weblogger IDs are correct
- Click launch button in Cloud launch.
- Press the start button for 3 seconds until the LED shows **Green**.
- Securely attach all Webloggers to the pallets/shipment

5

Notes:

- If you use a profile with no start delay the monitor/s will start recording immediately when you press the green start button.
- Where a predefined profile start delay is used or a start time is entered into Cloud Launch the sending site **MUST** ensure the start time is before the dispatch time.
- Attention:** Never plug Weblogger into the computer after launch, this will stop the Weblogger.
- You can check the Weblogger status by 'short pressing' the start button, if the light shows green, it has started, if the light shows red, it is **NOT** started. If not started, follow step 4c again.
- Placement of temperature monitors on the product is outlined in the AZ Quality and Compliance Manual procedure 8-P27
